OPENCHAIR · APP WALKTHROUGH · OCTOBER 2026

From a booking link to a picture that sells the meeting.

Every screen in this document is a real screenshot of the running app, taken from the code on branch **claude/youthful-mendel-b55o33**. The shops were scanned by the real pipeline reading recorded test pages (no live booking site was contacted).

29

Fade Lab's Chair Score: out of every 100 chair-hours it put online, 29 got booked.

01 · THE WHOLE FLOW ON ONE PAGE

How it works, end to end

A consultant pastes the public "Book now" links of shops in a niche and city. OpenChair reads each shop's online calendar once a night (read-only), scores how much of it got booked, and turns that into pictures the consultant sends to the owner.

STEP 1 · NEW SCAN

Paste links

Niche + city + booking links. Bad links are refused with a reason.

`CI3 · oc_scan_request`

STEP 2 · DISCOVERY

Recognise

The platform is recognised from the link's shape, nothing is fetched. A business is created and queued.

`service · discover job`

STEP 3 · WORKER

Read the calendar

The Booksy or Square adapter reads open slots per chair. Every read is checked before it is kept.

`worker · read-only`

STEP 4 · METER

Score it

Chair Score, confidence, band and an unsold range priced from the shop's own menu, for the next 7 days.

`service · Meter`

STEP 5 · SCREENS

Show it

The business screen and five cards draw the shop's real week, chair by chair, hour by hour.

`CI3 · Chair Week`

STEP 6 · SEND

Share it

The consultant sends a link, phone image or PDF themselves. OpenChair never contacts the shop.

`/c/{token} · 30 days`

The one number: Chair Score. Out of every 100 chair-hours a shop puts online, how many got booked. Higher = busier.

Hungry · under 50 · sell them customers

Steady · 50–84 · uneven week

Slammed · 85+ or 10+ day wait · sell capacity

Every night
Each shop is read once, however many consultants watch it. Watching only raises its priority.

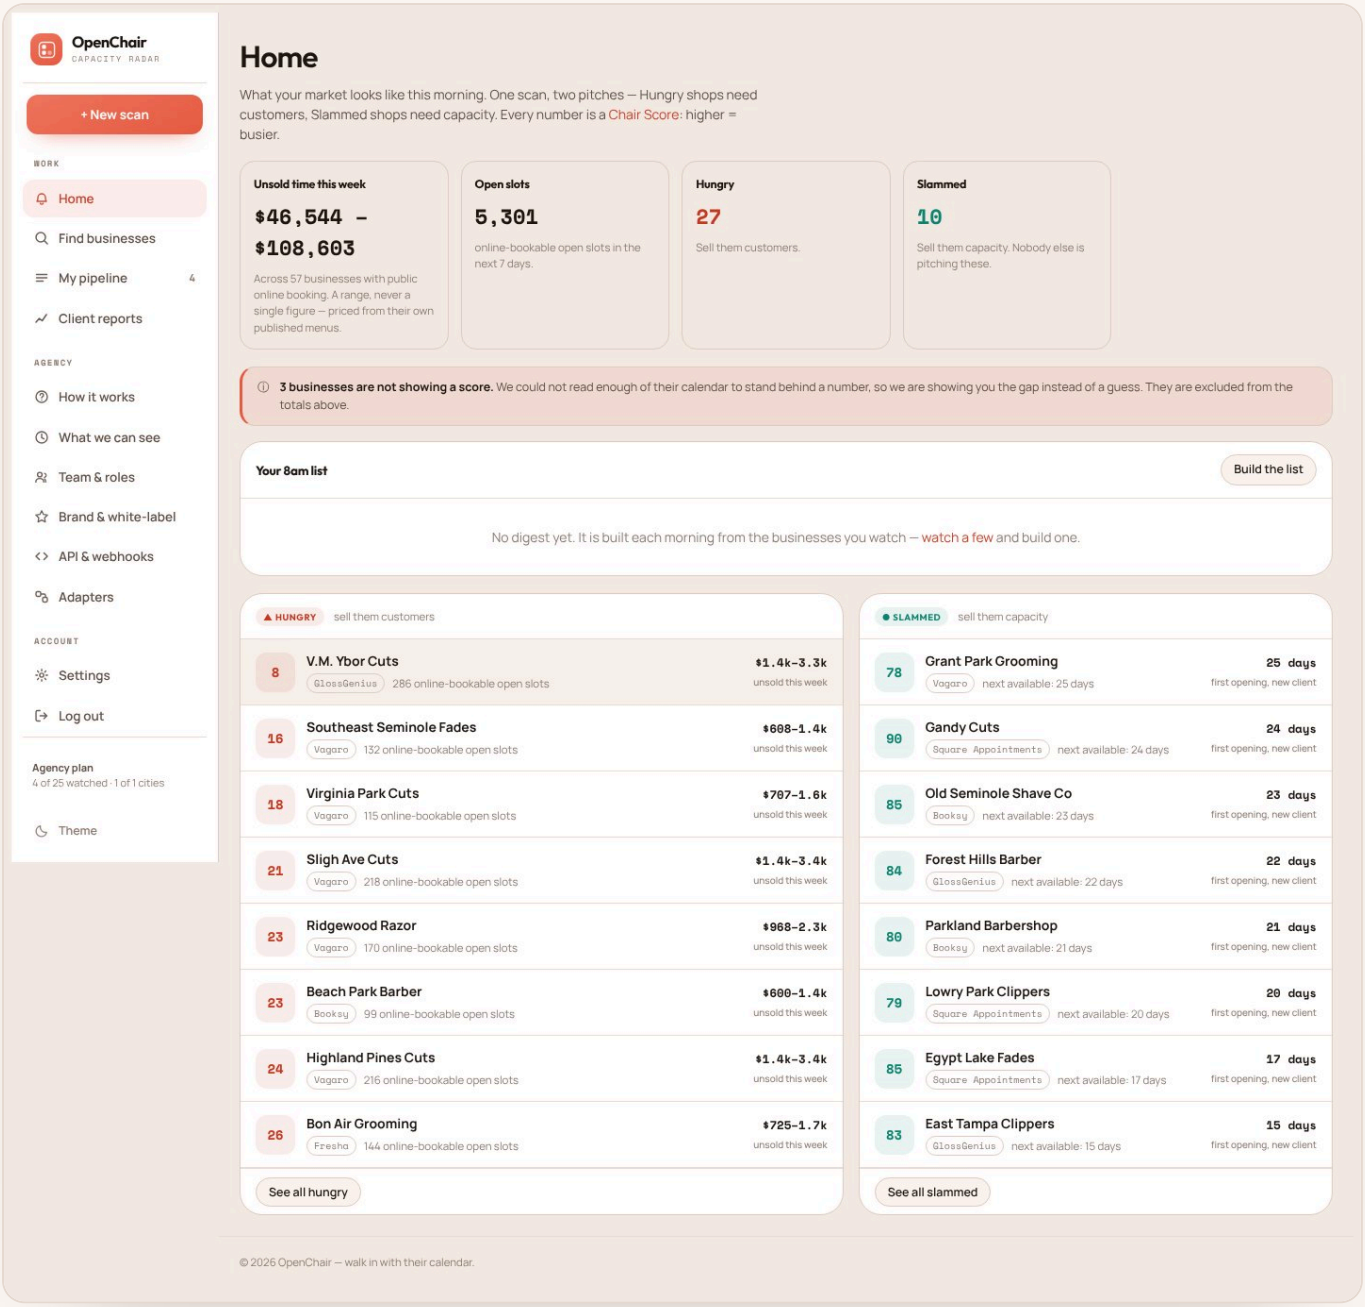

A first read is not published
The Meter needs two earlier reads and builds confidence over four weeks. Until then the screens say "Not enough data yet".

Every figure is honest
Money is always a range, data age is always printed, and what couldn't be seen (walk-ins, phone bookings) is stated.

Teams share one pipeline
An agency owner and their team see the same scans, prospects and share links. Work is assigned within the team.

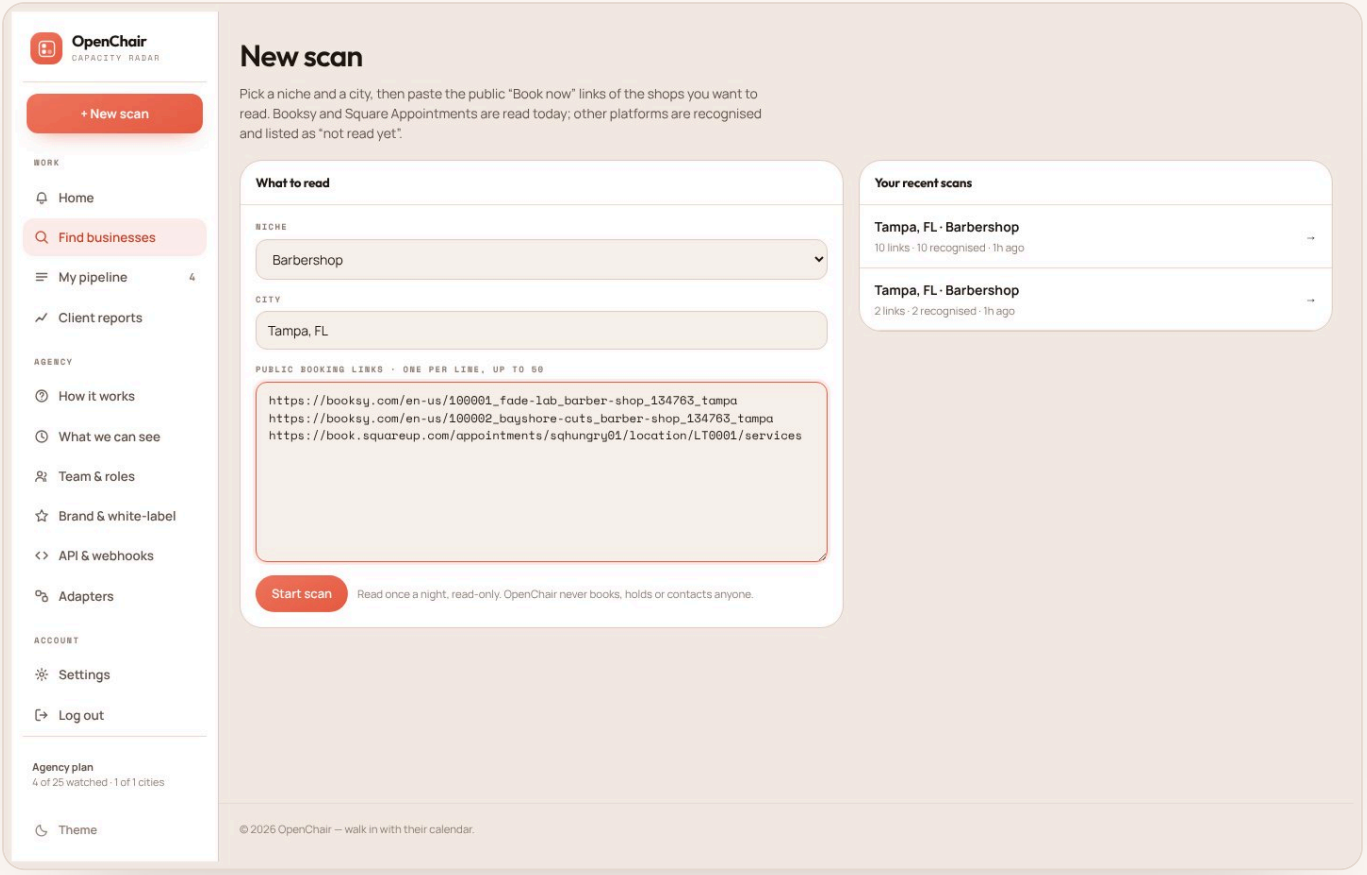

1 Log in, then Home

Home is the morning view of the market: total unsold time, how many shops are Hungry and Slammed, and the two lists side by side. Each row shows the Chair Score and the shop's second number: unsold money for Hungry, the wait for Slammed. The sidebar has **+ New scan**, the "due" count and the plan's usage.

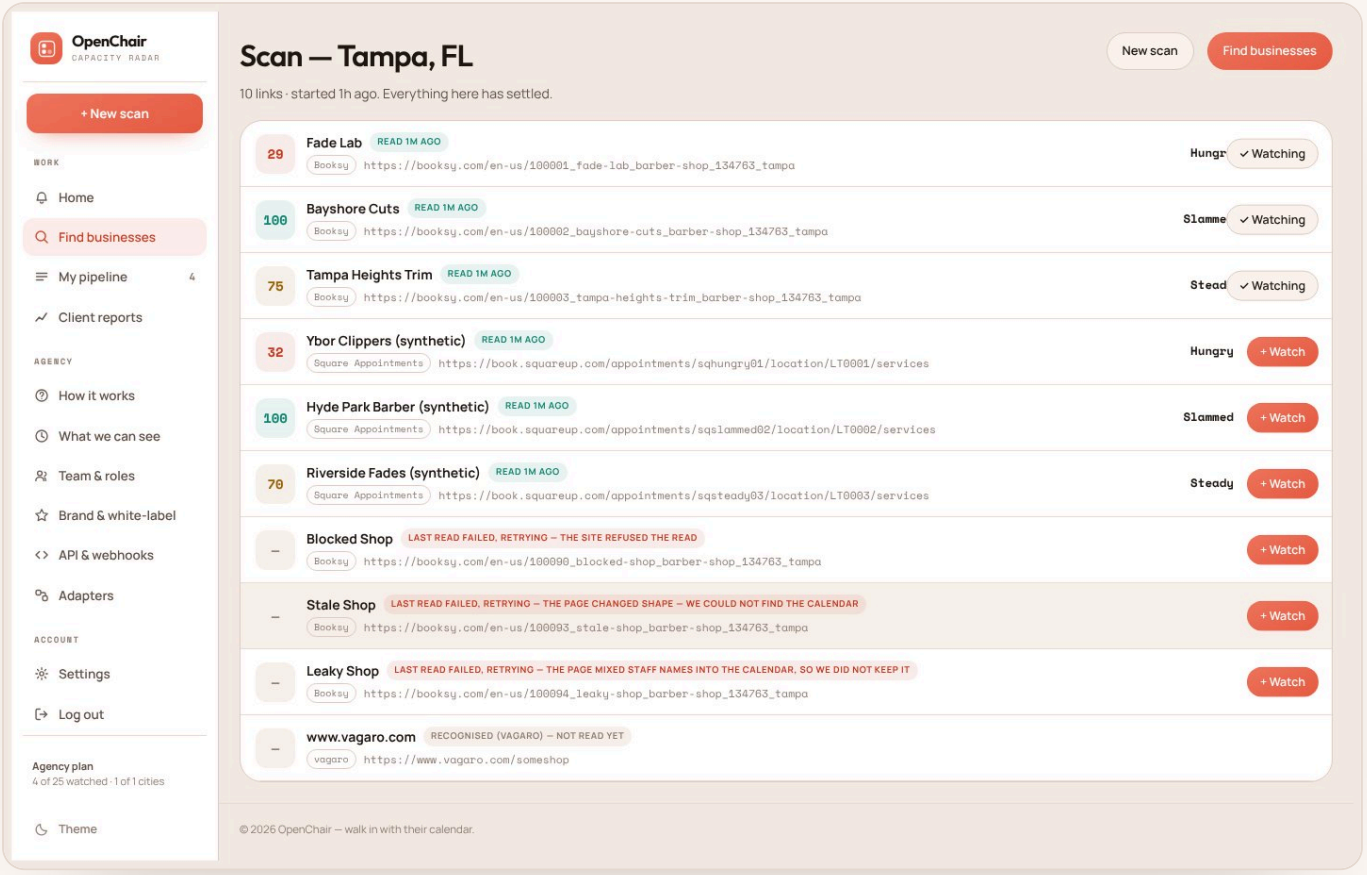

2 New scan: paste the booking links

Pick a niche, type the city as "City, ST", and paste the shops' public booking links, up to 50. Nothing is fetched when you press Start. The links are recorded and the service recognises each platform from the link's shape. Links that aren't https, point at an IP address or carry a password are refused with a reason. A team can start 20 scans an hour.

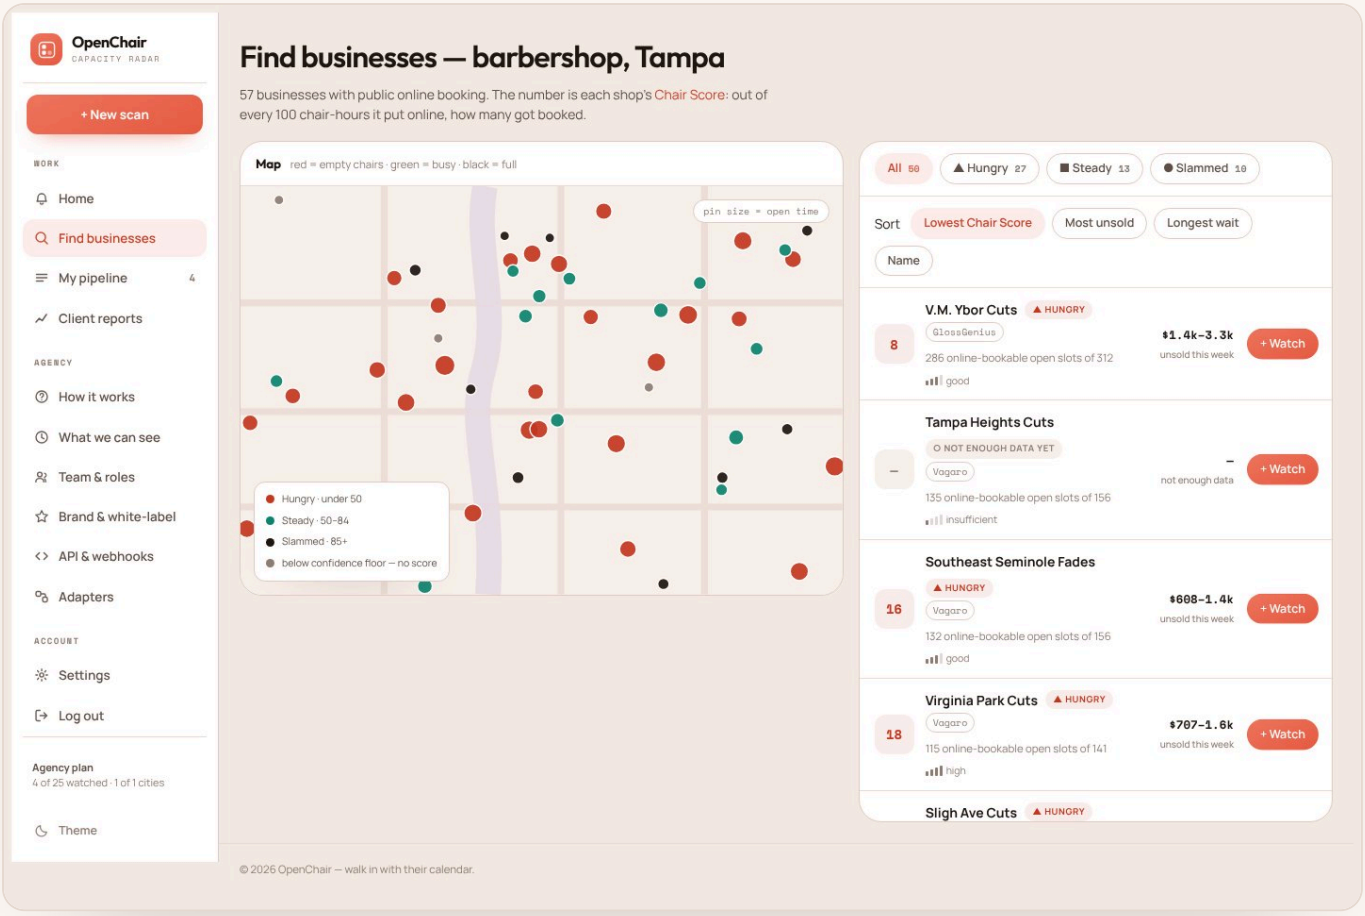

3 Scan progress

One row per link, in plain words. Shops read successfully show their Chair Score and band. Failed reads say why: the site refused the read, the page changed shape, or **the page mixed staff names into the calendar, so we did not keep it**. A platform without an adapter yet (Vagaro here) is listed as "not read yet". The page refreshes itself while anything is still moving.

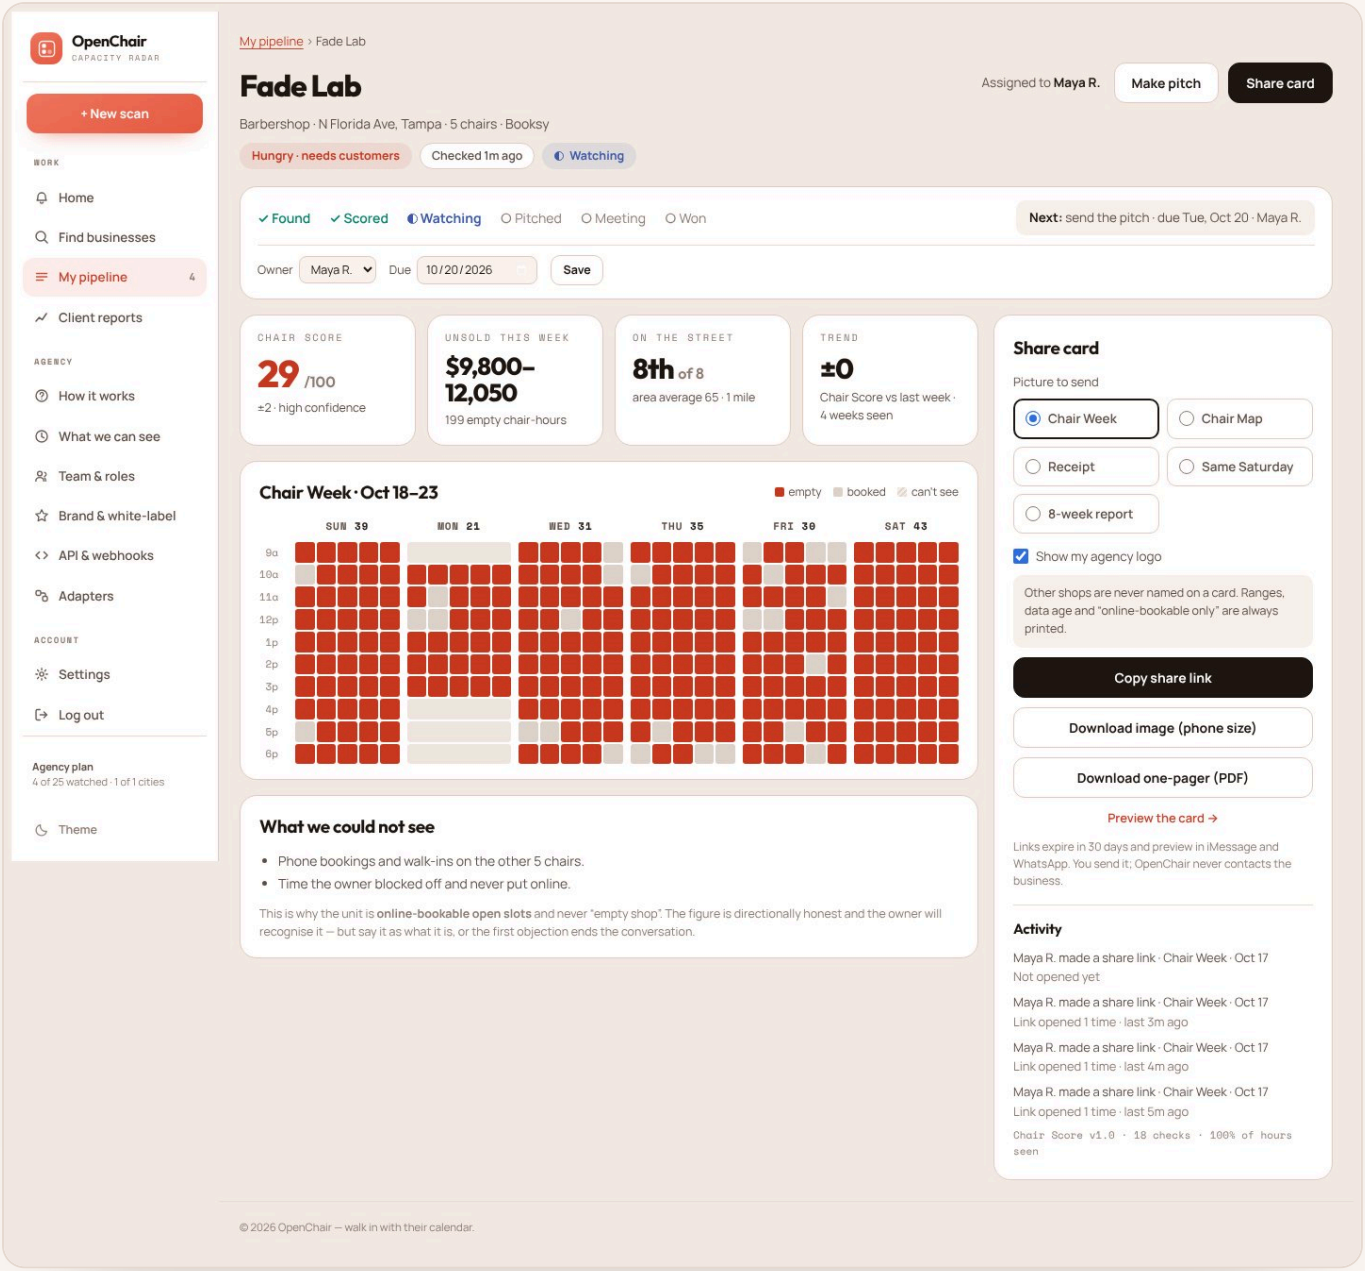

4 Find businesses

Every shop in the market on a map and in a ranked list. Pins use the cards' colours: red for empty chairs, green for busy, black for full. Filter by band, sort by lowest Chair Score, most unsold or longest wait, and **+ Watch** a shop to add it to the pipeline. Shops below the confidence floor show "—", never a guessed number.

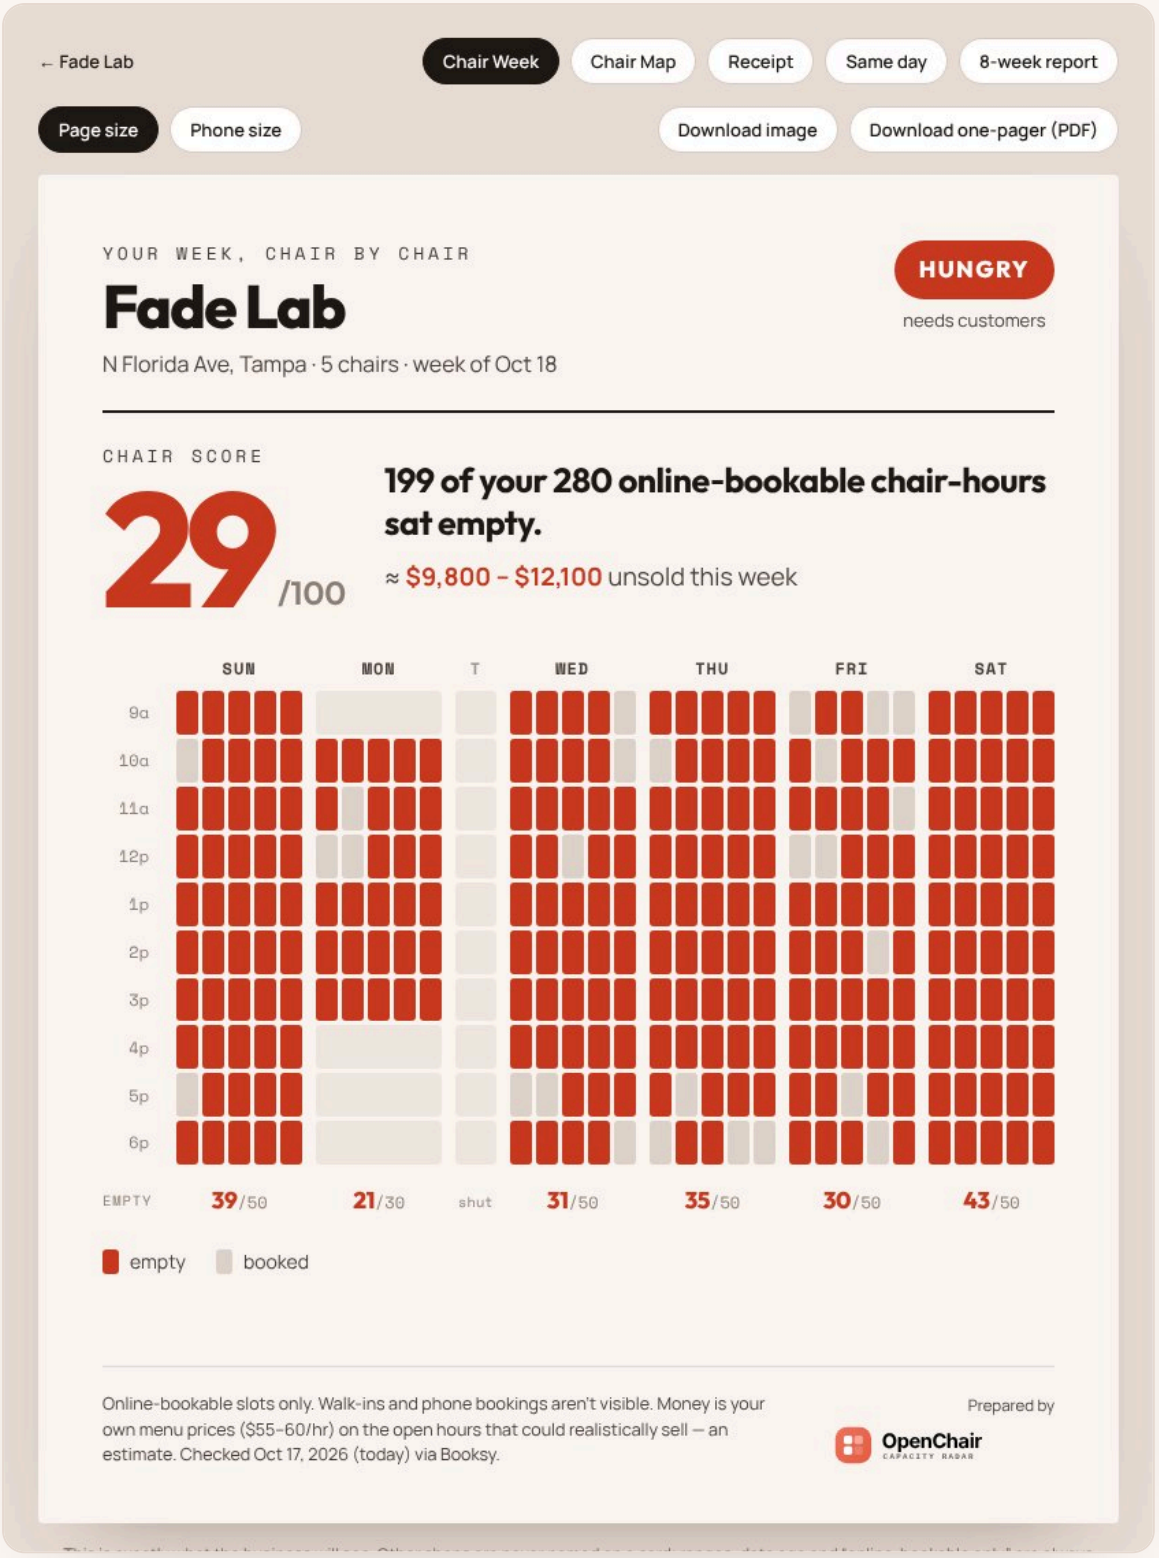

5 The business screen

Fade Lab, read from its Booksy page. The page shows the pipeline steps with owner and due date, then the Chair Score with its margin, unsold this week, rank on the street and trend. The **Chair Week** below is the shop's real week, chair by chair, with "What we could not see" stated plainly. The **Share card** panel picks a card, copies a link, or downloads an image or PDF. Activity logs who made each link and how often it was opened.

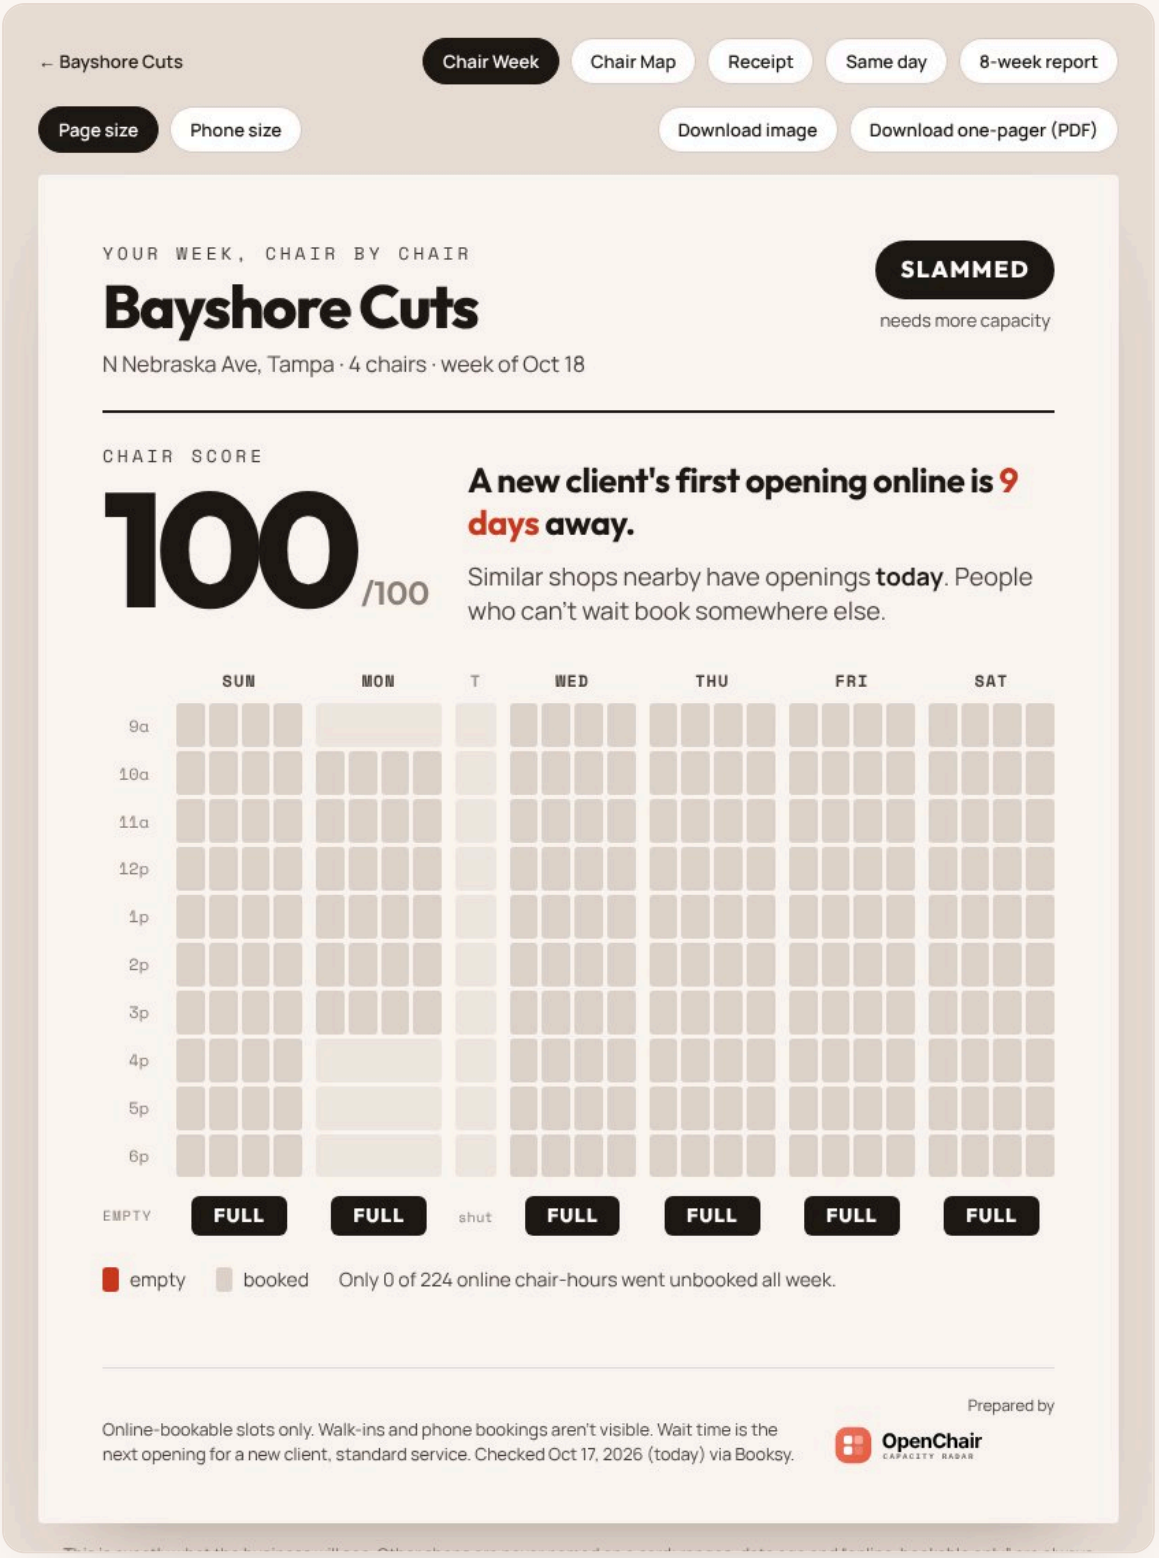

6 Chair Week, a Hungry shop

"199 of your 280 online-bookable chair-hours sat empty." Each tile is one chair for one hour; red is empty. The numbers come from the minutes the shop published, so they match the score exactly. The money is a range priced from the shop's own menu. "Prepared by" carries the agency's own brand.

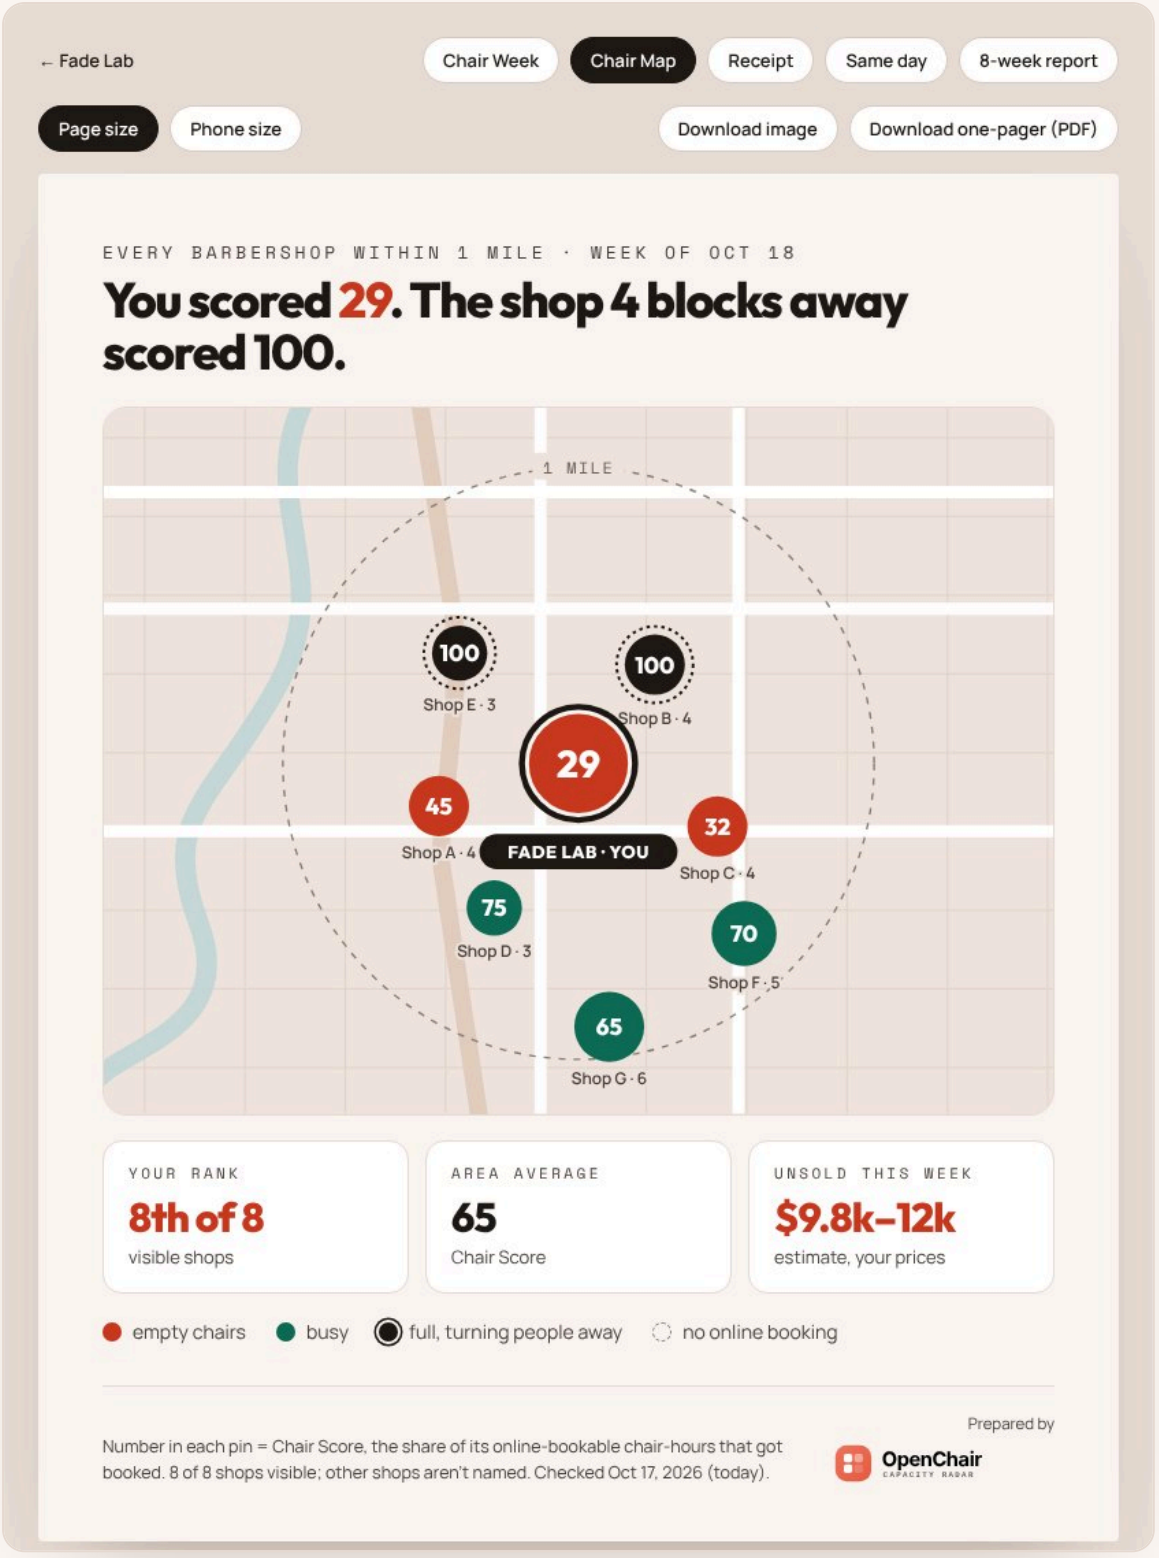

7 Chair Week, a Slammed shop

Bayshore Cuts is fully booked for the next week, so the second number is the wait instead of money: **"A new client's first opening online is 9 days away."** The pitch is capacity: waitlists, deposits, a second chair. This is the half of the market other tools don't sell to.

8 Chair Map: their street

Every shop within the radius with its Chair Score, placed by real location, with the subject's rank and the area average. Pasted shops get their map point from their own booking page. Other shops appear as "Shop A, Shop B…", never by name. Dashed "?" pins are shops with no online booking, so what couldn't be counted is visible.

9 Receipt: unsold chair time

The week as a till receipt, worst day first, with the worst window called out. The day lines add up exactly to the total, and the barcode is the week hour by hour.

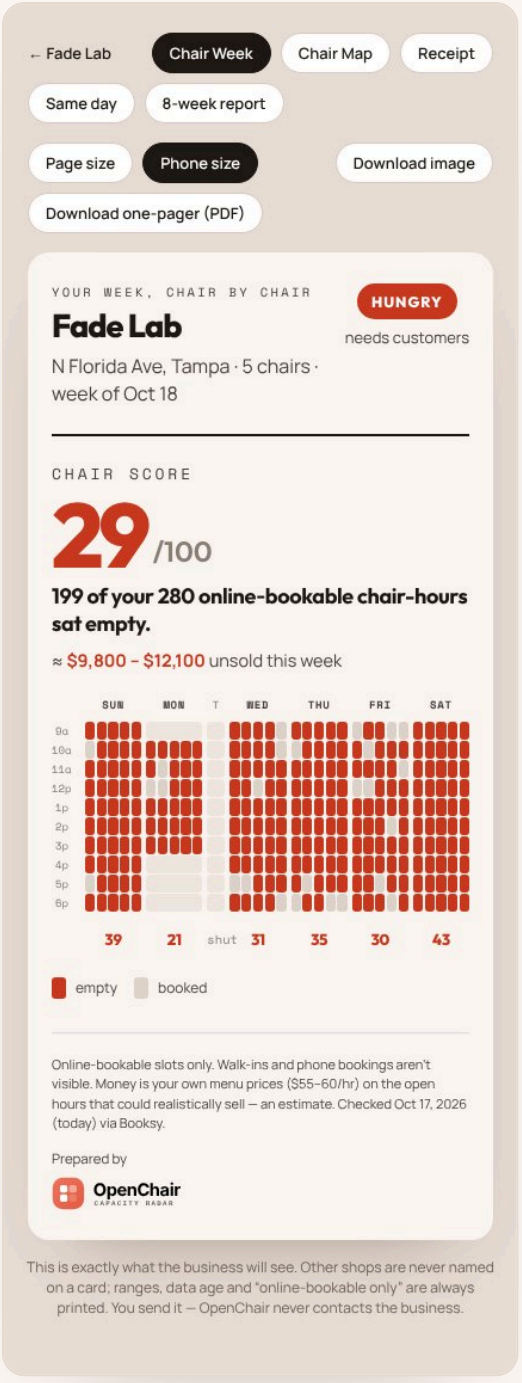

10 Same day, three shops

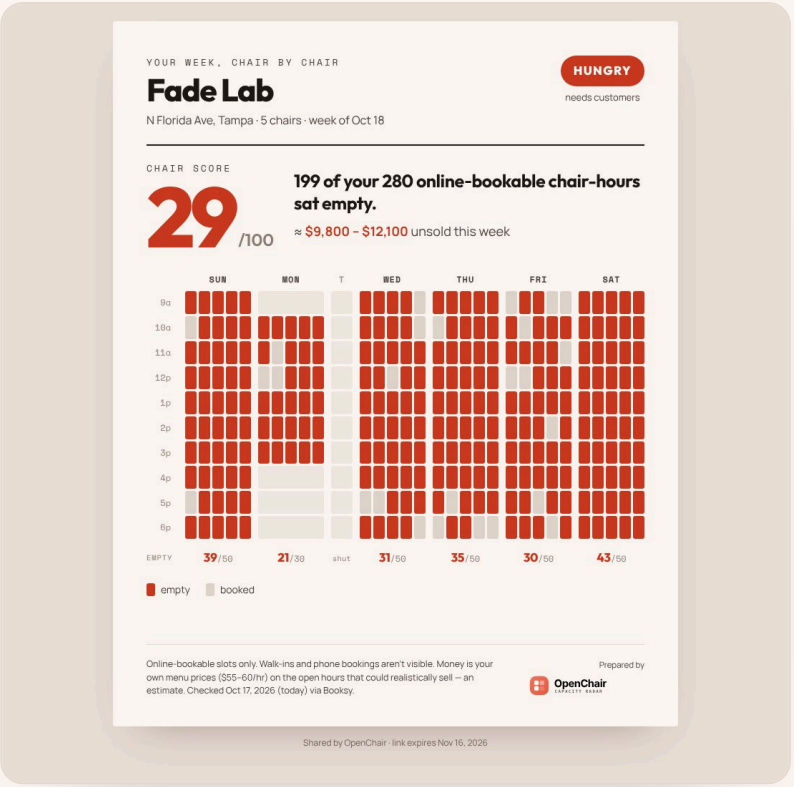

The shop's emptiest day beside the two busiest shops nearby, every chair, same hours. It answers "it's just a slow day" before the owner says it.

11 Phone image and the shared link

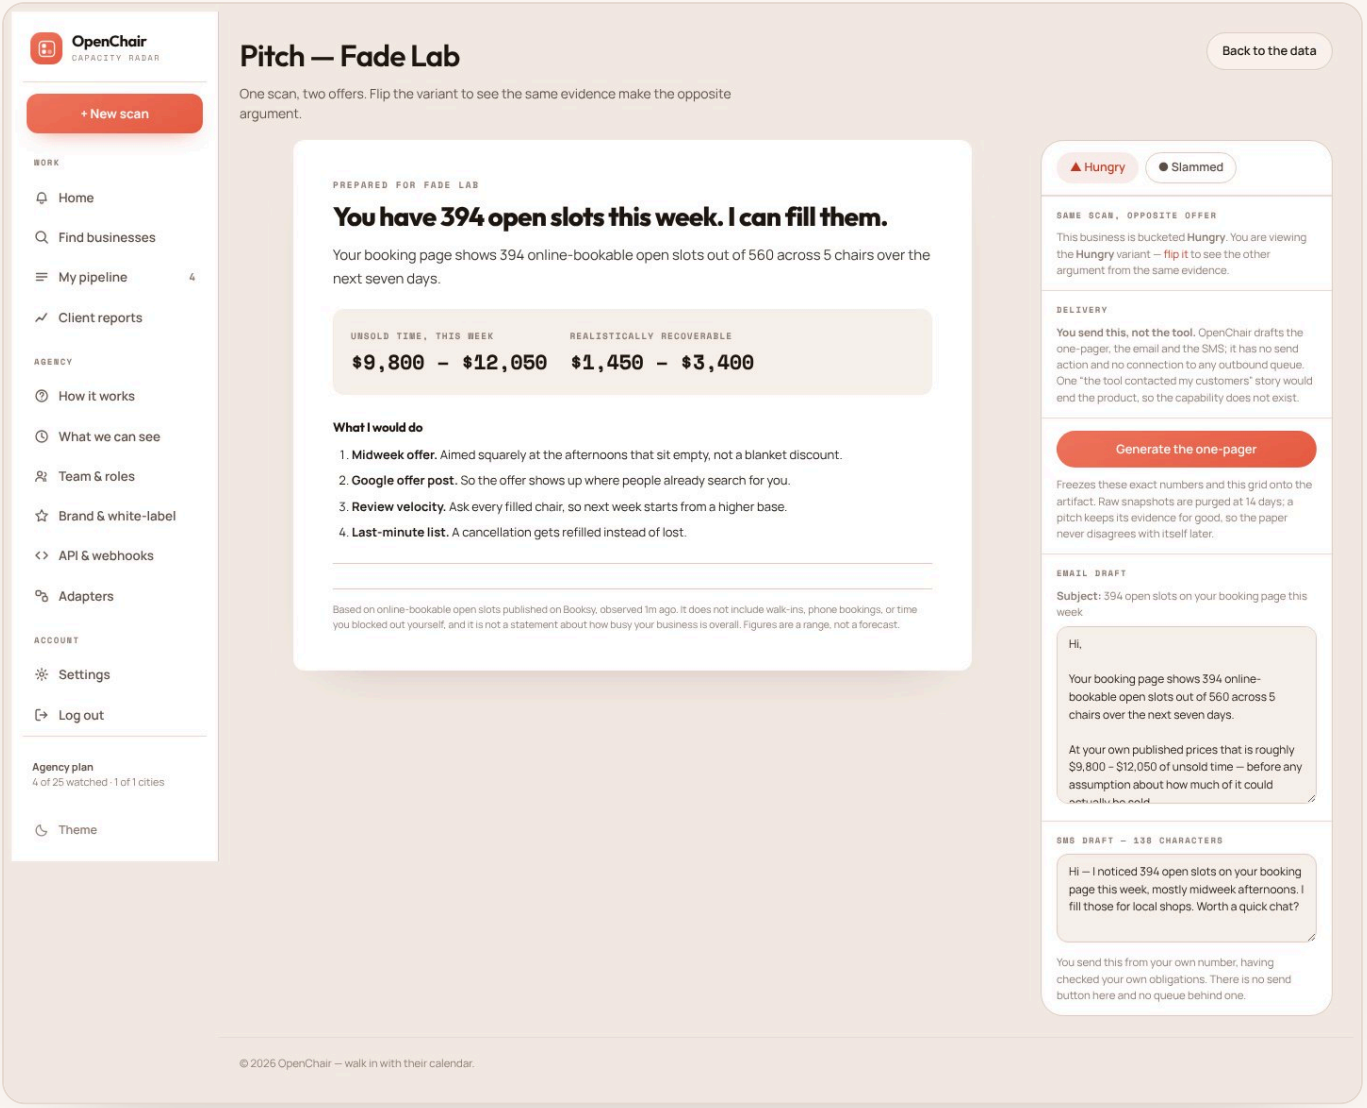

Left: the phone-size card that "Download image" saves as a PNG for iMessage or WhatsApp. **Right:** what the owner sees when they open the link, logged out. It's a frozen copy of exactly what was sent, hidden from search engines, expires in 30 days, and is rate-limited. Opens are counted without storing anything about the viewer.

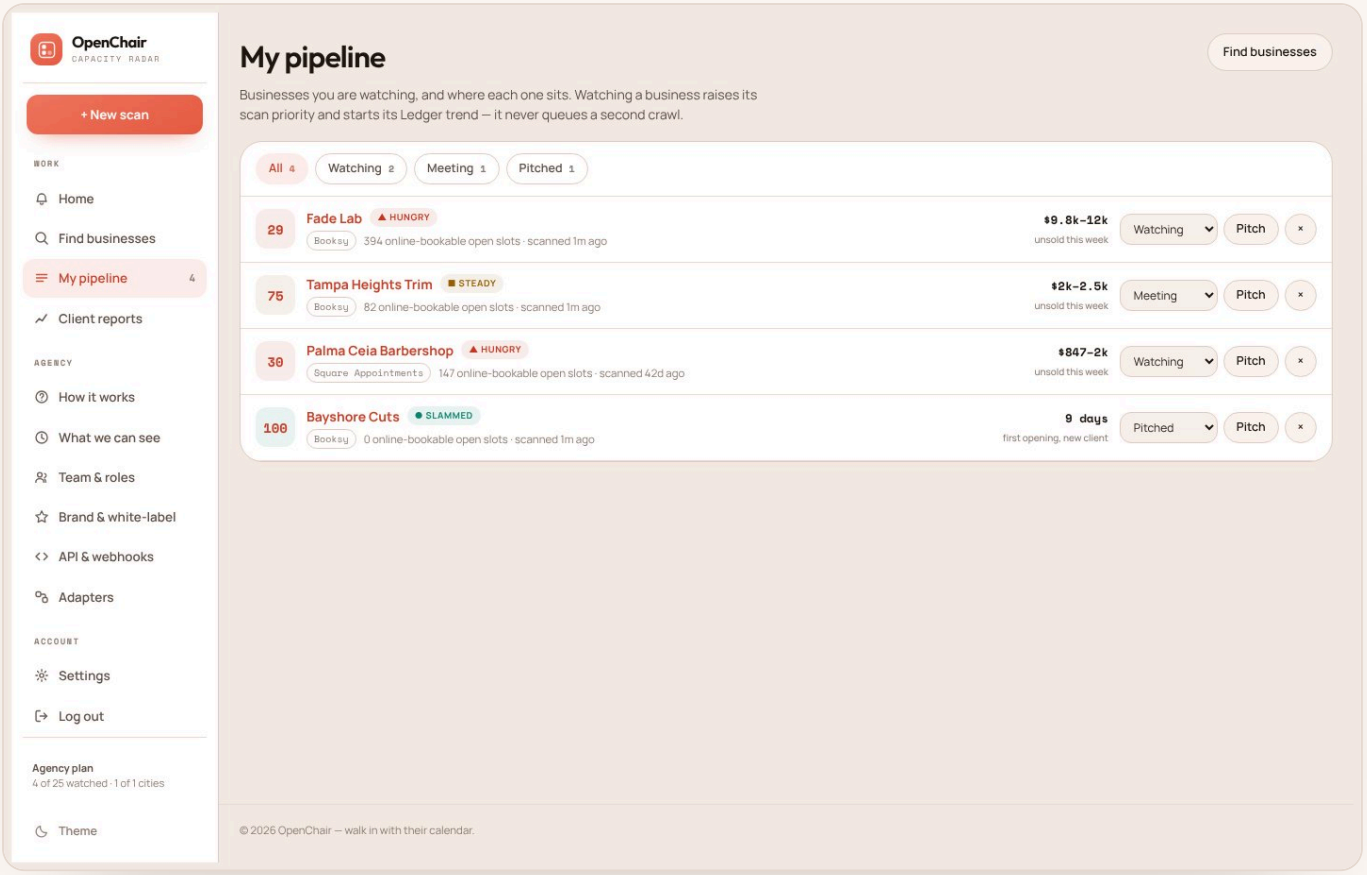

12 Pitch

The same scan written up as a one-pager, an email draft and an SMS draft. Every figure matches the cards: 394 open slots this week, $9,800–$12,050 unsold, and a smaller "realistically recoverable" range. Flip to the Slammed variant for the capacity pitch. There is **no Send button**: the consultant sends it from their own email or phone.

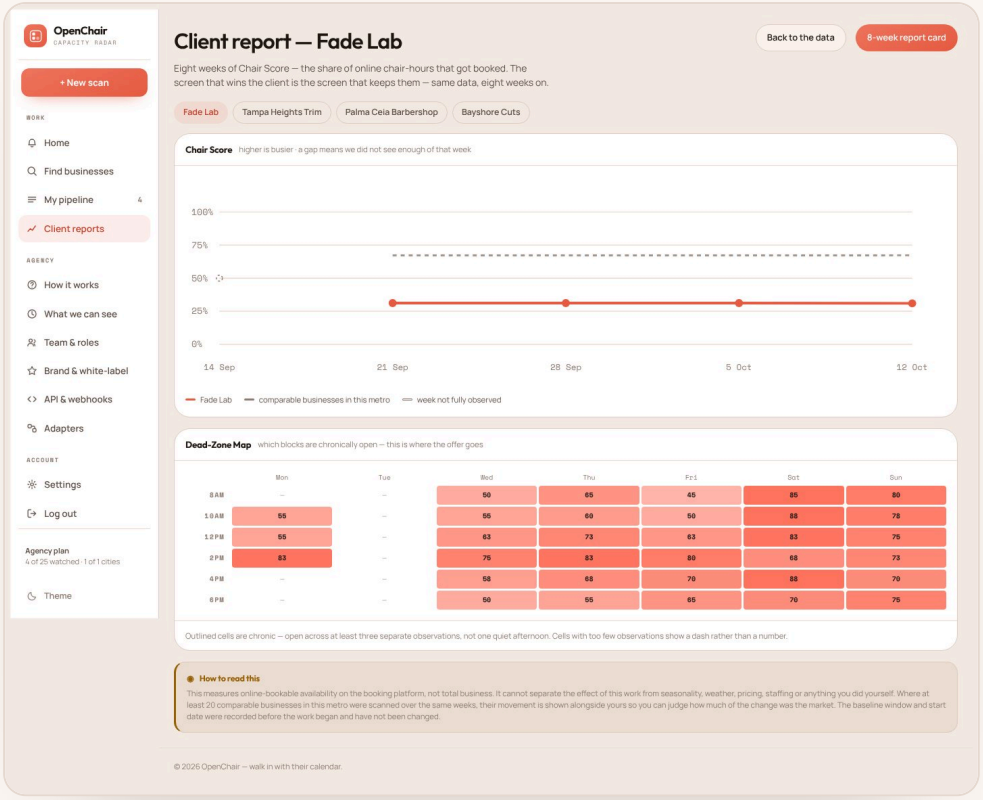

13 My pipeline

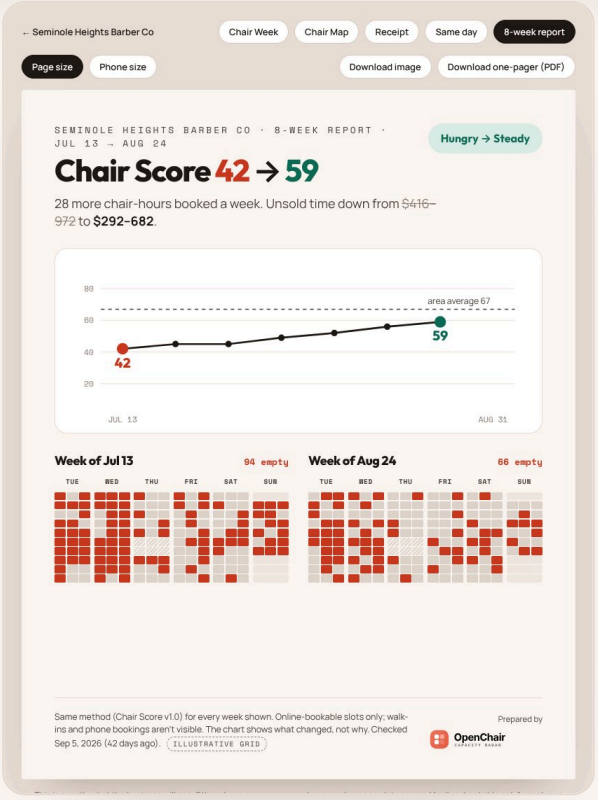

Every watched shop with its stage (watching, pitched, meeting, won), Chair Score and second number: money for Hungry, the wait for Slammed. The whole agency team shares this list.

14 Client report and the 8-week card

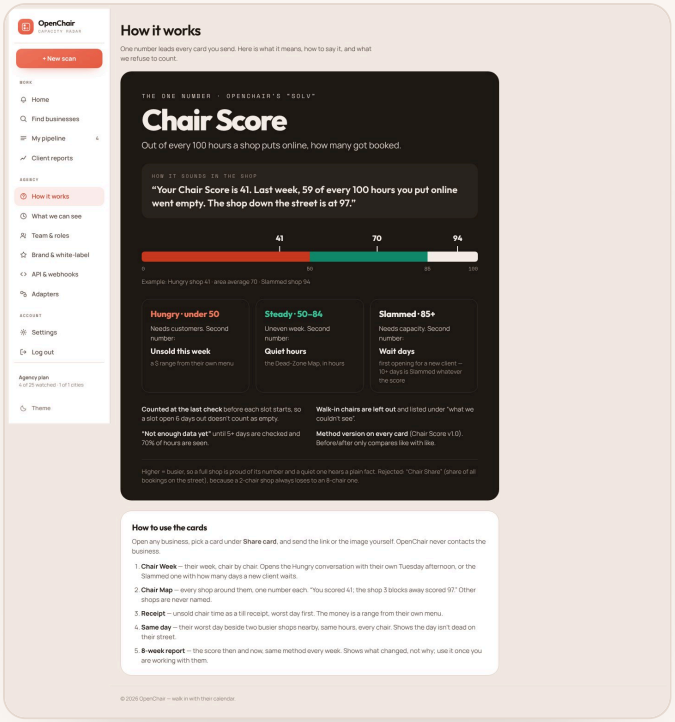

Top: the client report, with eight weeks of Chair Score against the market average, the dead zones and the change net of the market. **Bottom:** the 8-week report card the consultant sends. This one uses the sample market's seeded history, because the scanned shops have only a few weeks so far.

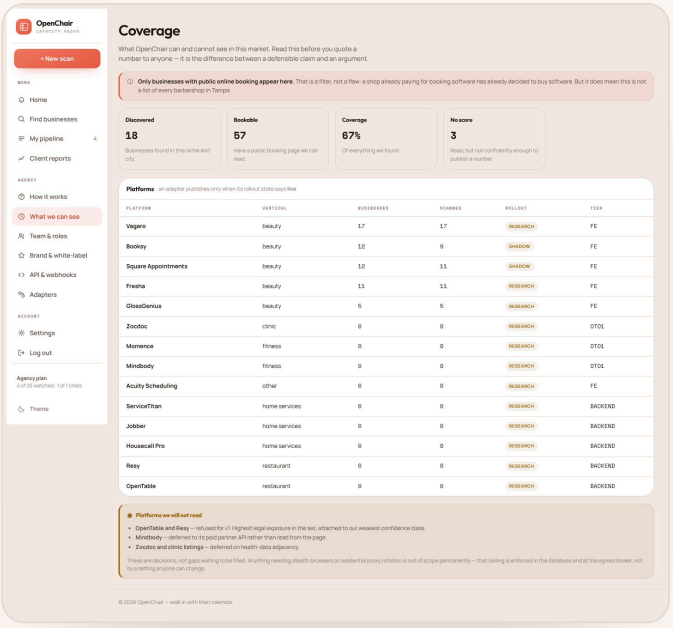

15 How it works, and What we can see

Left: the in-app explainer of the Chair Score, bands and method rules. Its thresholds are read from the same settings the code uses. **Right:** coverage, meaning which platforms are read, how many shops were found and how many have online booking.

Safety, privacy and what is real

The rules below are enforced in code and checked by 425 automated tests on every change (integrity 99, service 157, worker 112, read-only egress 57).

Read-only, structurally
An adapter can only read through a GET-only door. It has no way to book, hold, sign in or submit anything.

No live crawling yet
The worker reads recorded test pages by default. Reading real sites needs two explicit switches plus a platform set to "live".

No staff names, ever
Chairs are "Chair 1, 2…". A read that puts a staff name in the calendar data is refused and not stored.

Never contacts the business
There is no Send button and no path from a pitch to email or SMS. The consultant sends everything themselves.

Honest numbers
Money is always a range from the shop's own menu, data age is on every card, and below the confidence floor the screens say "Not enough data yet".

Shared links are private
Links are unguessable, hidden from search engines, expire in 30 days and are rate-limited. Other shops are never named on a card.

Teams and plans
An agency team shares one pipeline. Plan features are blocked by URL, not just hidden, and gating switches on once the access codes are set.

Production locks
The services refuse to start without their secret tokens. Security headers go on every page. Background jobs run only from the command line.

What is real and what is not yet. Every screen, number and calculation here is produced by the app. The Booksy and Square pages the worker read are **synthetic test pages**, built because live crawling is switched off. Before going live, the planned trial should record real pages, re-check both adapters against them, then switch them on. On a first-ever read the Meter says "Not enough data yet". The scanned shops here show scores because four weeks of nightly reads were simulated in the local preview database.
